

## L01: the Expectation Operator

Gonzalo Ferrer

30 January 2023

#### 1 Probability: A refresh on some useful definitions

The random variables x and y are called independent if:

$$p(x,y) = p(x)p(y).$$

More intuitively, two random variables are <u>independent</u> if there is no observable relation between them, for instance, the current weather in (first r.v.) and the grade you will get in the course (second r.v.).

**Note:** In this course p(x) indicates probability density function (PDF). For a review on random variables and PDFs, check out the probability review notes.

Product rule

$$p(x,y) = p(x|y)p(y)$$

Total probability

$$p(x) = \int p(x, y)dy$$
 (marginalization)

$$p(x|z) = \int p(x, y|z)dy$$

Bayes Theorem

$$p(x|y) = \frac{p(y|x)p(x)}{p(y)} = \frac{p(y|x)p(x)}{\int p(x,y)dx}$$

Def: Expectation Operator

$$\mathbb{E}\{x\} = \int_{-\infty}^{+\infty} x \cdot p(x) dx = \mu_x$$

# 2 Properties

 $\mathbb{E}\{\cdot\}$  is linear

- $\mathbb{E}\{A\} = A$
- $\mathbb{E}\{Ax\} = A\,\mathbb{E}\{x\}$
- $\mathbb{E}{A+x} = A + \mathbb{E}{x}$
- $\mathbb{E}\{x+y\} = \mathbb{E}\{x\} + \mathbb{E}\{y\}$ :

$$\mathbb{E}\{x+y\} = \int \int (x+y)p(x,y)dxdy =$$

$$= \int \int xp(x,y)dxdy + \int \int yp(x,y)dxdy =$$

$$= \int x \left(\int p(x,y)dy\right)dx + \int y \left(\int p(x,y)dx\right)dy =$$

$$= \int xp(x)dx + \int yp(y)dy = \mathbb{E}\{x\} + \mathbb{E}\{y\}$$

#### 3 Anti-properties

- $\mathbb{E}\{x,y\} \neq \mathbb{E}\{x\}\mathbb{E}\{y\}$  (in general)
- If x, y uncorrelated  $(\sigma_{xy} = 0) \Rightarrow \mathbb{E}\{x, y\} = \mathbb{E}\{x\}\mathbb{E}\{y\}$
- If x, y independent  $\Rightarrow x, y$  uncorrelated.

#### 4 Expectation of multi-dimensional r.v.

$$\mathbb{E}\bigg\{\begin{bmatrix}x\\y\end{bmatrix}\bigg\} = \begin{bmatrix}\mathbb{E}\{x\}\\\mathbb{E}\{y\}\end{bmatrix}$$

### 5 Conditional expectation

$$\mathbb{E}\{x|y\} = \int_{-\infty}^{+\infty} x \cdot p(x|y) dx$$

#### 6 Covariance. Scalar form

Autocovariance or covariance

$$\sigma_{xx}^2 = cov(x,x) = \mathbb{E}\big\{(x - \mathbb{E}\{x\})^2\big\} = \mathbb{E}\{x^2\} - \big(\mathbb{E}\{x\}\big)^2$$

Cross-covariance

$$\sigma_{xy}^2 = cov(x, y) = \mathbb{E}\{(x - \mathbb{E}\{x\})(y - \mathbb{E}\{y\})\}\$$

## 7 Covariance. Vectorial form

Covariance

$$\Sigma_x = cov(x, x) = cov(x) = \mathbb{E}\{(x - \mathbb{E}\{x\})(x - \mathbb{E}\{x\})^\top\}$$

Cross-covariance

$$\Sigma_{xy} = cov(x, y) = \mathbb{E}\left\{ (x - \mathbb{E}\{x\})(y - \mathbb{E}\{y\})^{\top} \right\}$$

Example: Expand  $\Sigma_{xy}$ .

$$\Sigma_{xy} = \mathbb{E}\left\{(x - \mathbb{E}\{x\})(y - \mathbb{E}\{y\})^{\top}\right\}$$

$$= \mathbb{E}\left\{xy^{\top} + x\left(-\mathbb{E}\{y\}\right)^{\top} - \mathbb{E}\{x\}y^{\top} + \mathbb{E}\{x\}\mathbb{E}\{y\}^{\top}\right\} =$$

$$= \mathbb{E}\left\{xy^{\top}\right\} - \mathbb{E}\left\{x\mathbb{E}\{y\}^{\top}\right\} - \mathbb{E}\left\{\mathbb{E}\{x\}y^{\top}\right\} + \mathbb{E}\left\{\mathbb{E}\{x\}\mathbb{E}\{y\}^{\top}\right\} =$$

$$= \mathbb{E}\left\{xy^{\top}\right\} - \mathbb{E}\left\{x\right\}\mathbb{E}\left\{y\right\}^{\top} - \mathbb{E}\left\{x\right\}\mathbb{E}\left\{y^{\top}\right\} + \mathbb{E}\left\{x\right\}\mathbb{E}\left\{y^{\top}\right\} =$$

$$= \mathbb{E}\left\{xy^{\top}\right\} - \mathbb{E}\left\{x\right\}\mathbb{E}\left\{y^{\top}\right\} = \Sigma_{xy}$$

Col 1:  $\Sigma_x = \Sigma_x^{\top}$  (is symmetric. But  $\Sigma_{xy}$  is <u>not</u> symmetric)

$$\Sigma_x = \mathbb{E}\{xx^{\top}\} = \mathbb{E}\left\{ \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} \cdot \begin{bmatrix} x_1 & x_2 & x_3 \end{bmatrix} \right\} = \mathbb{E}\left\{ \begin{bmatrix} x_1x_1 & x_1x_2 & x_1x_3 \\ x_2x_1 & x_2x_2 & x_2x_3 \\ x_3x_1 & x_3x_2 & x_3x_3 \end{bmatrix} \right\}$$

Col 2:  $\Sigma_x$  is Positive (Semi)definite or PSD:  $v^{\top}\Sigma_x v \geq 0 \ \forall v$  Proof:

$$v^{\top} \Sigma_x v = v^{\top} \mathbb{E} \left\{ (x - \mathbb{E} \{x\})(x - \mathbb{E} \{x\})^{\top} \right\} v = \mathbb{E} \left\{ \underbrace{v^{\top} (x - \mathbb{E} \{x\})}_{u \text{ is now a scalar.}} (x - \mathbb{E} \{x\})^{\top} v \right\}$$
$$= \mathbb{E} \left\{ u \cdot u \right\} \ge 0$$

### 8 Sample mean and sample covariance

 $x_i \sim p(x) \text{ iid}$ Sample mean

$$\bar{x} = \frac{1}{N} \sum_{i=1}^{N} x_i$$

Sample covariance (unbiased estimate)

$$\overline{\Sigma}_x = \frac{1}{\underbrace{N-1}} \sum_{i=1}^{N} (x_i - \bar{x})(x_i - \bar{x})^{\top}$$
